C:Complex: An immunoglobulin heterotetramer subunit consists of two identical light (hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into C:Superfamily: immunoglobulin C region; immunoglobulin homology C:Keywords: duplication; glycoprotein; heterotetramer; immunoglobulin F:20-85/Domain: immunoglobulin homology <IML>
F:317-206/Domain: immunoglobulin homology <IMS>

A;Title: Primary structure of human gamma3 immunoglobulin deleti
A;Reference number: A90442; MUID:81021548
A; Molecule type: mRNA
A; Residues: 12-70;72-114;116-125,'E',127-133,'L',135-136,'E',138,'Y',140-154,'D',156-157
A; Note: a carboxyl-terminal Lys is removed posttranslationally
A; Note: this sequence may represent an allelic form or another gamma chain subclass
C; Comment: The heavy chain disease protein Wis is shown.
                                                                                                                                                          A;Molecule type: protein
